

AMENDMENTS TO THE ABSTRACT

Please replace the Abstract of the Disclosure currently of record as follows:

-- A learning system and method applies computer network and achieves an online language learning through integration of local learning and remote companion speech learning. The local user selects a curriculum topic from a database for learning. A user-mating module establishes network connections according to the online user status. A curriculum-coding module encodes the characteristics of the curriculum contents and transfers the characteristic codes to the remote user site. A curriculum-decoding module at the remote user site receives and decodes the characteristic codes to generate correspondent curriculum pages. A page synchronization module returns and updates the curriculum pages for the users. Therefore, the local and remote users take speech learning on the curriculum pages through audio/video communication.--
